# How to access the Greek HPC Infrastructure ARIS

- High-Performance Computing (HPC) is the ability to perform sophisticated calculations at high speeds.
- An HPC cluster consists of hundreds or thousands of compute servers, so-called nodes. The nodes in each cluster work in parallel with each other.
- HPC solves large problems in science, engineering, or business, that are too complex for a PC. On typical PC it might take e.g. hours, days, weeks to perform the computations, but if you use an HPC Cluster, it might only take minutes, hours, days, respectively.

Νέα / Εκπαίδευση - Διεθνείς Συνεργασίες - Επιστημονικά Αποτελέσματα -100

Υπερυπολογιστικές Υπηρεσίες ΕΔΥΤΕ Α.Ε. Το Εθνικό Δίκτυο Υποδομών Τεχνολογίας και Έρευνας παρέχει υπολογιστκούς πόρους υψηλών επιδόσεων στις ελληνικές και διεθνείς επιστημονικές και ερευνητικές κοινότητες για την πραγματοποίηση επιστημονικής έρευνας.

#### Κατάσταση Συστημάτων

Partition	Status	Jobs (R/Q)	Nodes (A/F)
compute	up	55 / 43	381/0
gpu	up	13 / 18	39/5
fat	up	4/0	21/9
taskp	up	0/0	0/10
viz	up	0/0	0/2
short	up	1/0	5/11
ml	up	0/0	0/1

### https://www.hpc.grnet.gr

EURO Greece

#### Who Can Access the System?

- Scientists and researchers affiliated with Greek academic and research institutions
- The system is free to use

#### How to Gain Access?

- Researchers submit project proposals to gain access
- Proposals can be submitted as:
  - **Preparatory/Development** projects, through an <u>ongoing</u> open call
  - **Production** projects during <u>periodic</u> calls

#### What is required?

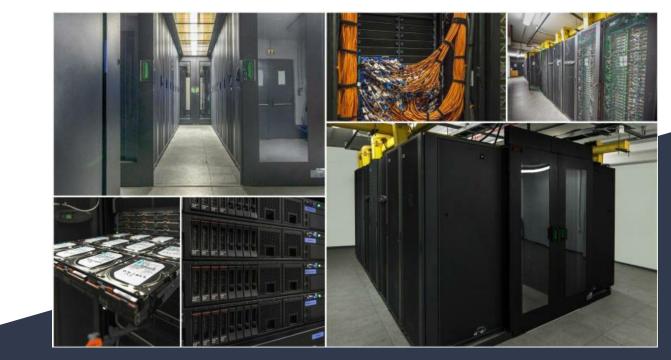

- A clear description of the intended application
- Justification for the need for an HPC system
- Specific computational resource requirements (e.g., number of processors, memory size)
- Expected scientific benefits

#### Which Applications are to be used?

- Scientific applications using parallel processing methodologies such as:
  - Distributed memory on multiple nodes (MPI)
  - Shared memory on single nodes (OpenMP)
  - CUDA (for GPU acceleration)
- Applications simulate physical phenomena requiring extensive mathematical computations
- Machine Learning (ML) and neural network training benefiting from GPU acceleration

- 533 compute nodes organized in
   5 partitions/islands (node groups)
- Resource Manager: Slurm v. 16.05.11
- Operating System: Red Hat Enterprise Linux 6 & 7
- File System: 2PB IBM GPFS
- Interconnection network:
   Infiniband 56 Gbps
- Processing capability: 535 TFlops
- No. 468 in the Top 500 list of June of 2015

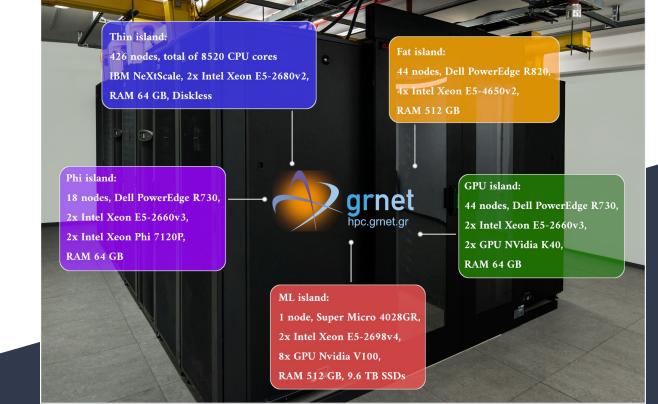

- GRNET HPC team has managed the installation, maintenance, and operation of the GRNET National HPC System ARIS since 2015
- Unified usage method for all applications through dedicated environments
- The heterogeneous system (CPU, GPU, Xeon Phi) supports users and a wide range of application software
- All software is installed from source and optimized for system hardware
- The team has extensive experience in compiling, optimizing, and delivering diverse software to meet user requirements.

- It offers 2 PB of storage through IBM's General Parallel File System (GPFS)
- IBM TS3500 tape library, providing a maximum storage capacity of approximately 6 PB

### **Preparatory/Development Projects**

rnet

- The call for preparatory/development projects is open continuously
- Evaluation results are provided within 10 business days of submission
- Selected projects start within 1 month after evaluation
- Provide access to ARIS for researchers in Greek institutions to:
  - Preparatory Type A: Perform scalability tests
  - Development Type B: Support code migration and optimization
- Duration: Up to 2 months for Type A, and 4 months for Type B

### **Preparatory/Development Projects**

- The maximum number of core hours provided in detail:
  - a. 100,000 core hours on the Thin Node Island
  - b. 50,000 core hours on the GPU Island
  - c. 50,000 core hours on the Xeon Phi Island
  - d. 100,000 core hours on the Fat Node Island
- The total requested core hours must not exceed 100,000 core hours
- Users should fill the submission form
- View form in PDF: preparatory.pdf

grnet

• <u>Report</u> after 2 months and within 30 days after project completion

### **Production Projects**

- The call for <u>production</u> projects is periodically (2 times per year)
- Allocate up to 5 million core hours per project (total max 41 million core hours)
- The application must be completed in English
- PI must be affiliated with a Greek academic/research institution
- International collaborators allowed, but cannot be PIs
- Commitment to utilizing allocated resources and acknowledging ARIS in publications
- GRNET reserves the right to publish project summaries and performance results
- Access to the System ends 12 months after the acceptance/allocation date
- Final report for approved projects: 2 months after access ends

### **Production Projects**

- Selection Criteria
  - 1. Scientific Excellence (K1): Impact, novelty, and adherence to international standards
  - 2. **Need for Use (K2)**: Justification for using ARIS HPC resources
  - 3. Adequacy (K3): Experience and expertise of PI and team
  - 4. **Applicability (K4)**: Compatibility with ARIS system and resource availability
- Total: 41 million core hours allocated as follows:
  - Thin nodes: 30 million core hours
  - Fat nodes: 7 million core hours
  - GPU nodes: 3 million core hours
  - Intel Xeon Phi nodes: 1 million core hours
  - Machine learning: 30,000 GPU-card hours

### **Production Projects**

- Evaluation Process
  - 1. Stage A: Eligibility & Completeness Check
  - 2. Stage B: Technical Evaluation (Feasibility K4)
  - 3. Stage C: Scientific Evaluation (K1, K2, K3) Peer review
  - 4. Stage D: Ranking & Resource Allocation Technical Committee decision
- Scores range from Low (1) to Excellent (4) for each Ki and overall proposal
- Proposals with "Low" overall quality score are rejected before final stage
- If resources are limited, the Committee may reduce allocations based on minimum evaluator recommendations to support more proposals
- Notifications sent via email with further instructions
- Users should fill the <u>form</u>
- View form in PDF: production.pdf
- Additional file: <u>detailed project document-6.doc</u>
- <u>Report</u> submission required within 30 days after project completion

- The second state to the instant second first the second state is the Technology Dec
- The system's technical specifications are available in the <u>Technical Description</u>
- The access and usage policies are outlined in the <u>ARIS Access Policy</u>
- ARIS <u>Terms of Use</u> (Acceptable Usage Policy)
- User should accept the <u>Privacy Policy</u>
- For detailed information and announcements, register for the HPC Announcement List
- ARIS <u>Documentation</u>

### nttps://doc.aris.grnet.gr

# JOB LIFECYCLE

- User Access: User access HPC via ssh
- Job Submission: User submits a job using sbatch.
- **Pending (PD)**: Job waits in queue for resources to become available.
- **Scheduled**: SLURM assigns resources based on priority and availability.
- **Running (R)**: Job executes on allocated resources.
- Completion (CG/COMPLETED): Job finishes successfully or fails.
- Failure/Preemption: Job may fail due to errors or get preempted by higher-priority jobs.
- Job Cleanup: SLURM releases resources, logs results.

# SLURM - Resource and Job Management System

EURO Greece

- <u>sacct</u> is used to report job accounting information
- <u>sbatch</u> is used to submit a job script for later execution
- <u>scancel</u> is used to cancel a pending or running job
- sinfo reports the state of partitions and nodes managed by SLURM
- <u>squeue</u> reports the state of jobs
- <u>srun</u> usually is executed inside the job script to run apps after job submission

More info https://slurm.schedmd.com

#### **Managing Environment with Modules**

- Modules control environment variables such as PATH, LD\_LIBRARY\_PATH.
- Use **module** command to load, unload, and list modules.

#### **Module Commands**

- module avail: List all available modules.
- module load <module>: Load a module.
- module unload <module>: Unload a module.
- module list: List loaded modules.
- module switch: Switch between module versions.
- module purge: Remove all modules.
- Example of loading a module with a certain version:
  - > module load gnu/5.1.0

> gcc --version gcc (GCC) 5.1.0

► Available compilers : GNU, Intel, PGI, Sun(Oracle)

- ► Available MPI Flavors : IntelMPI, OpenMPI, MVapiCH.
- ▶ Best Compiler flags, more flags may be needed
- ► GNU : -O3 -mavx -march=ivybridge
- ► Intel : -O3 -xCORE-AVX-I
- ► PGI : -O4 -tp=sandybridge
- ► MPI :
- ► IntelMPI (Intel): mpiicc, mpiicpc, mpiifort
- ► OpenMPI(gnu/intel/pgi) : mpicc, mpicxx, mpif90

- Accessible from Internet via SSH at login nodes
- User must provide a username, SSH keys, and an IP range (at max /24) to be granted access
- Compute nodes are not directly accessible and they have no internet access
- File Transfer through secure protocols e.g. scp, sftp
- To connect, user need to have an SSH Client Software. For instance:
  - a. Mac OS, Linux: OpenSSH (usually pre-installed)
  - b. Windows: Putty, Bitvise, mobaXterm

#### Transfer files from/to ARIS

- Put a local directory from your computer to ARIS scp -i /path/to/rsa -r localdir username@login.aris.grnet.gr:remotedir
- Get a remote directory from ARIS to your computer scp -i /path/to/rsa -r username@login.aris.grnet.gr:remotedir localdir
- Clients: scp (Linux/Mac), or PSCP (Windows), or WinSCP (Windows)
